

In my exploration, machine learning where computers learn from data. The more data the computer receives, the better it becomes at doing tasks.

From machine learning, I discovered that computers can improve through experience, just like humans. They can find patterns in data and use them to make decisions. Machine learning is used in many everyday applications such as YouTube recommendations, voice assistants, and games. For example, in game, the game character does not know how to play, so they try moves like jumps, or attacks [randomly](#). If the character wins or get points is good. If the character lose which is bad, so the character remembers which actions is good and bad.
